

Diagram of the Human Eye

Name each part and give the function of each part:

Letter	Name of Part	Function of Part
A	Sclera	Connective tissue that covers the outside of the eye; it protects the eye and helps to maintain the eyeball like structure
B	Pupil	The opening of the eye that lets light enter the eye
C	Iris	The colored part of the eye surrounding the pupil; the iris can change diameter to let more or less light enter the pupil
D	Optic Nerve	This nerve connects the eye to the brain; it transmits signals between the eye and the brain to let the eye know how to work and to reverse the inverted image that forms
E	Cornea	The transparent outer dome shaped covering of the eye; the cornea is the first refracting surface of the eye
F	Retina	The light sensitive area at the back of

		the eye; this is the area that contains rods and cones and it is where the focal point forms if you have correct vision (where the image forms)
G	Lens (Convex)	A transparent optical device that bulges outward; the lens bends light as it enters from the pupil (this is the second refracting surface of the eye)
